

Is Non Invasive Lipo available now?

Yes, just give us a call for a FREE consultation on 212 234 4769

Does the treatment hurt?

Ultrasound Cavitation Lipo is a pain-free procedure and requires no anesthetic. During our procedure you will feel no pain. We often have clients fall asleep during their session. There is no anaesthetic or numbing agent required during the treatment.

What are the advantages of Cavitation over liposuction?

- No need for general or local anesthetic
- Non-Surgical and Non-Invasive
- No downtime – patients can return to normal day to day activities immediately (with liposuction surgery, downtime is usually 7-10 days)
- No risk of infection, scarring, downtime and irregularities

How long does the treatment take?

30-45 minutes for for Ultrasound Cavitation depending on area treated.

How soon will I see results?

Often results are visible with the first session but will improve further over the course of 6 treatments. We will assess the final results after completing your initial bookings. Maximum results require at least 6 to 12 treatment sessions per area depending on your size. However we find most clients will lose 1-3 inches after only 1 treatment. These results are not guaranteed and will depend on the clients response to treatment and area being treated. Treatment results depends on the individual, the fat thickness, and the area treated. Changes happen over a number of weeks, 12 weeks being the estimated time to see the maximum result, although some of our clients begin to see changes at around 2 weeks. In clinical trials 12 weeks post treatment, 9 out of 10 people saw an undeniable reduction in the treated area.

Will the effect be long-lasting?

The fat cells treated with will not return or re-grow, so that is a permanent effect. However, the length of time that the body shaping will last for is really in your hands. How much you eat and how much exercise you take will also affect your long-term body shape. So if you take in more calories than you use, you weight and fat will increase and the permanent removal of fat cells from your treatment will be hidden by your weight gain.

Are there any side effects?

Cavitation is an extremely safe treatment as it is non-surgical and non-invasive. However some people do experience some redness of the skin which should return to normal within a few hours. In extreme cases, some clients can experience bruising in the area being treated which is caused by the vacuum suction cup.

Is there any downtime?

None. You can return to work immediately following treatment

What happens after treatment?

You will need to avoid alcohol for 3 days after each treatment because your liver will be busy processing the fat that has been broken down by the Ultrasonic Lipo therapy. Also try to drink plenty of water and keep yourself hydrated before and after treatment. Patient should be advised that following treatment they should maintain a low calorie intake. This will ensure that fat energy released as a result of the treatment is used by the body.

How much does the treatment cost?

The Average price for a course of treatments of Cavitation depends on the area being treated. Prices start from as little as \$99 per course. If you wish to have multiple areas of your body reshaped, prices may vary depending on the number of areas to be treated and the patient's individual response to Ultrasound Cavitation Lipo.
